```

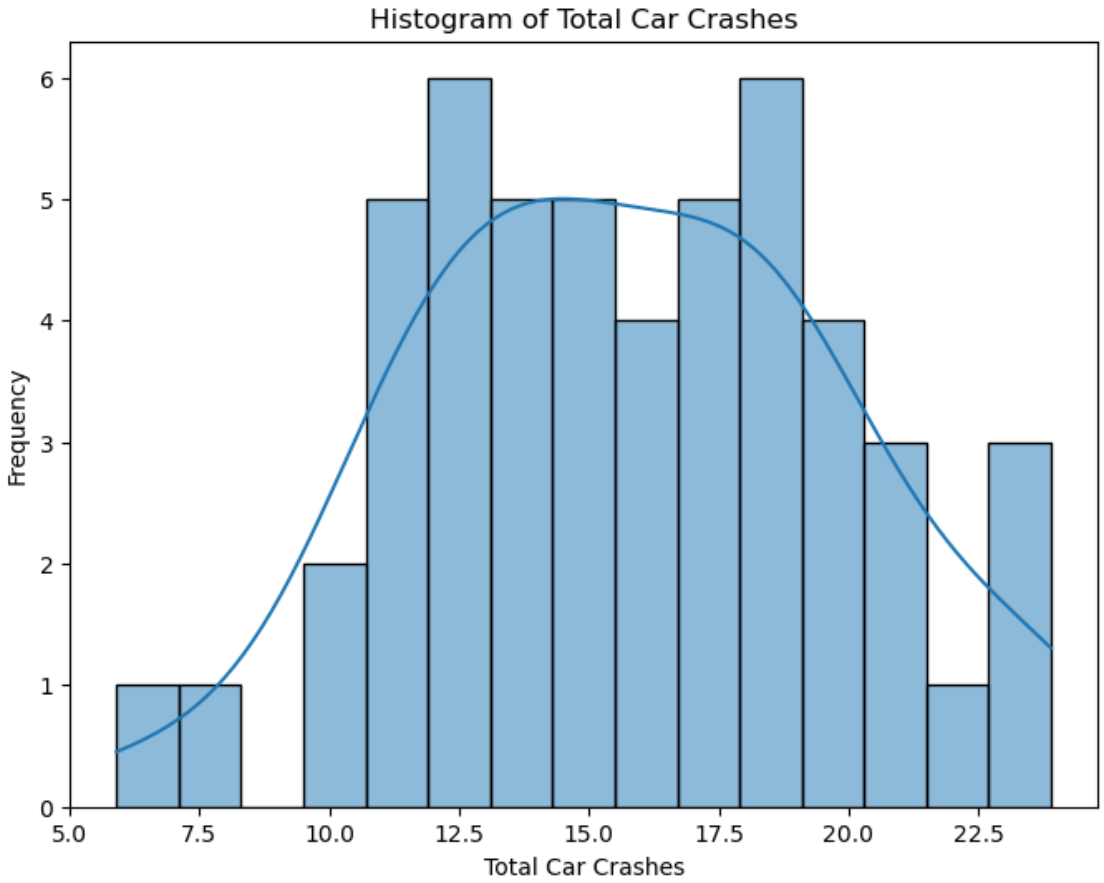
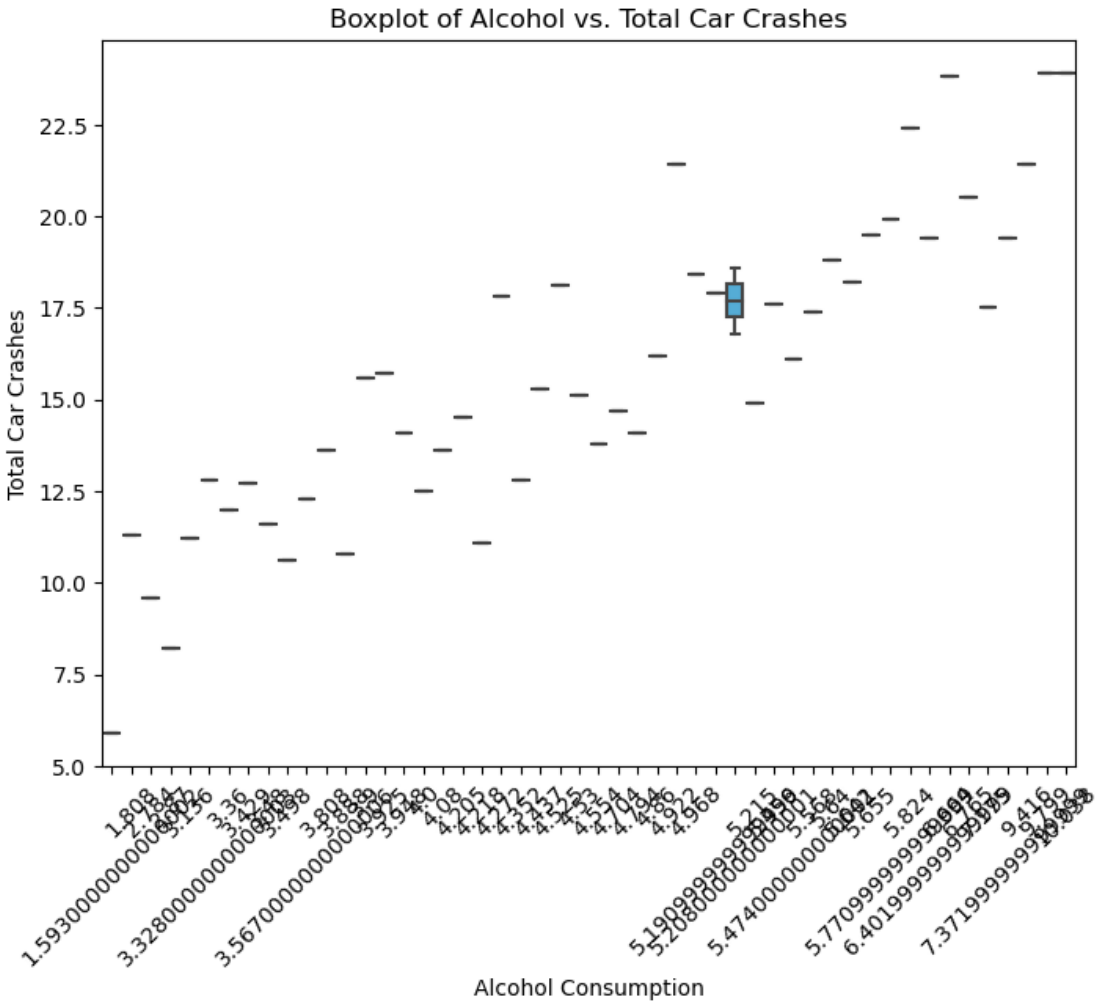
[6]:
```
# Data Visualization and Inferences
#Histogram of 'total' car crashes
plt.figure(figsize=(8, 6))
sns.histplot(car_crashes['total'], bins=15, kde=True)
plt.title("Histogram of Total Car Crashes")
plt.xlabel("Total Car Crashes")
plt.ylabel("Frequency")
plt.show()
# Inference: The histogram shows that the majority of states have a relatively␣
 ↪low total number of car crashes.
```



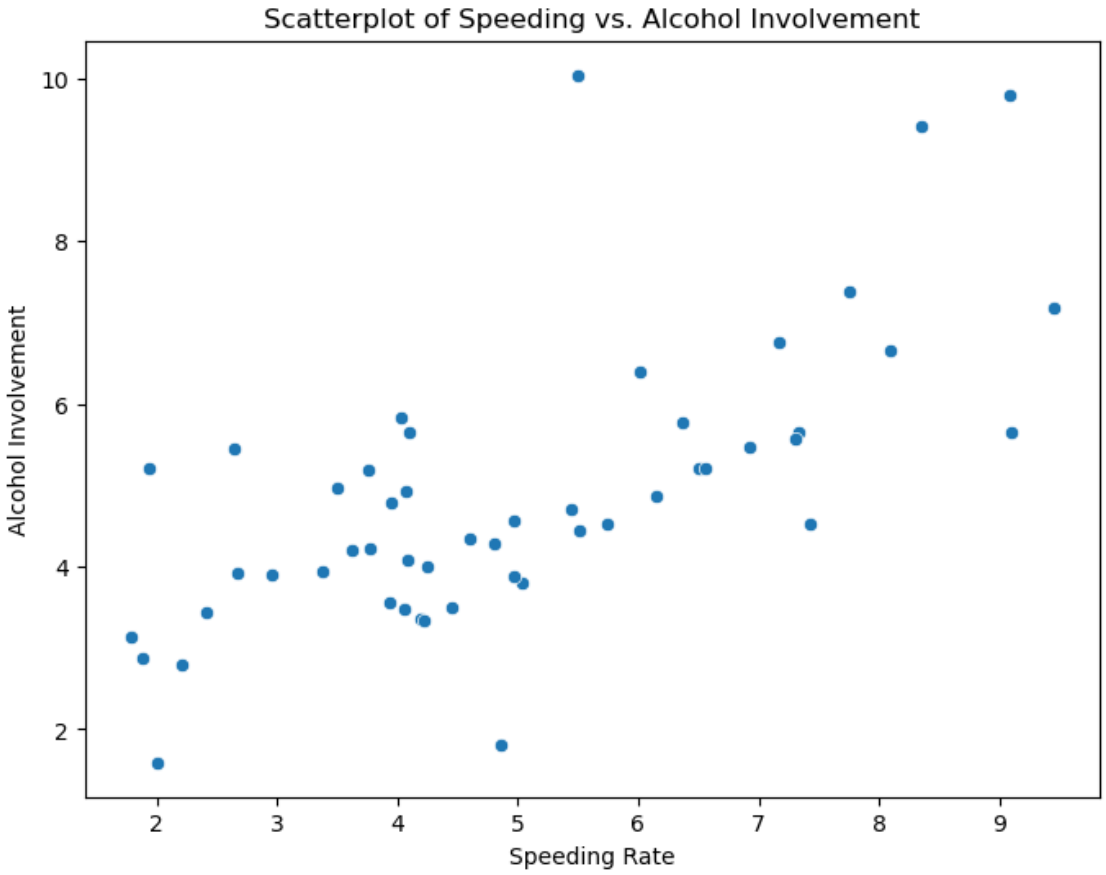
2 2. Boxplot of 'alcohol' vs. 'total' car crashes

[7]:
```
plt.figure(figsize=(8, 6))
sns.boxplot(x='alcohol', y='total', data=car_crashes)
plt.title("Boxplot of Alcohol vs. Total Car Crashes")
plt.xlabel("Alcohol Consumption")
plt.ylabel("Total Car Crashes")
plt.xticks(rotation=45)
plt.show()
# Inference: The boxplot indicates that states with higher alcohol consumption␣
 ↪tend to have a higher median total number of car crashes.
```



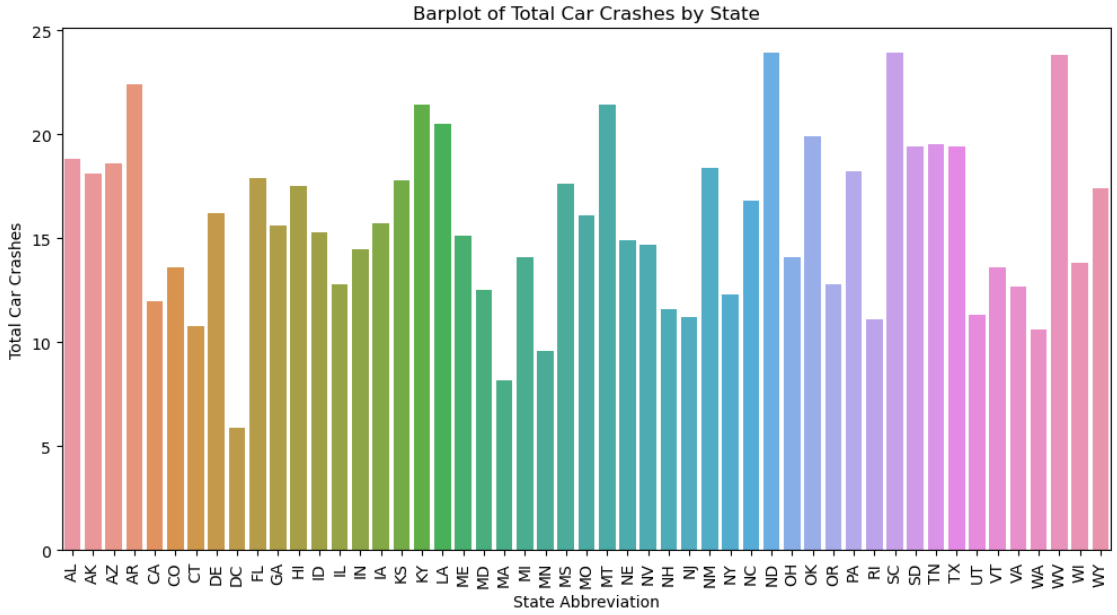
3 3. Scatterplot of 'speeding' vs. 'alcohol'

[8]:
```
plt.figure(figsize=(8, 6))
sns.scatterplot(x='speeding', y='alcohol', data=car_crashes)
plt.title("Scatterplot of Speeding vs. Alcohol Involvement")
plt.xlabel("Speeding Rate")
plt.ylabel("Alcohol Involvement")
plt.show()
# Inference: The scatterplot shows that there is a positive correlation between␣
↪speeding and alcohol involvement in car crashes.
```



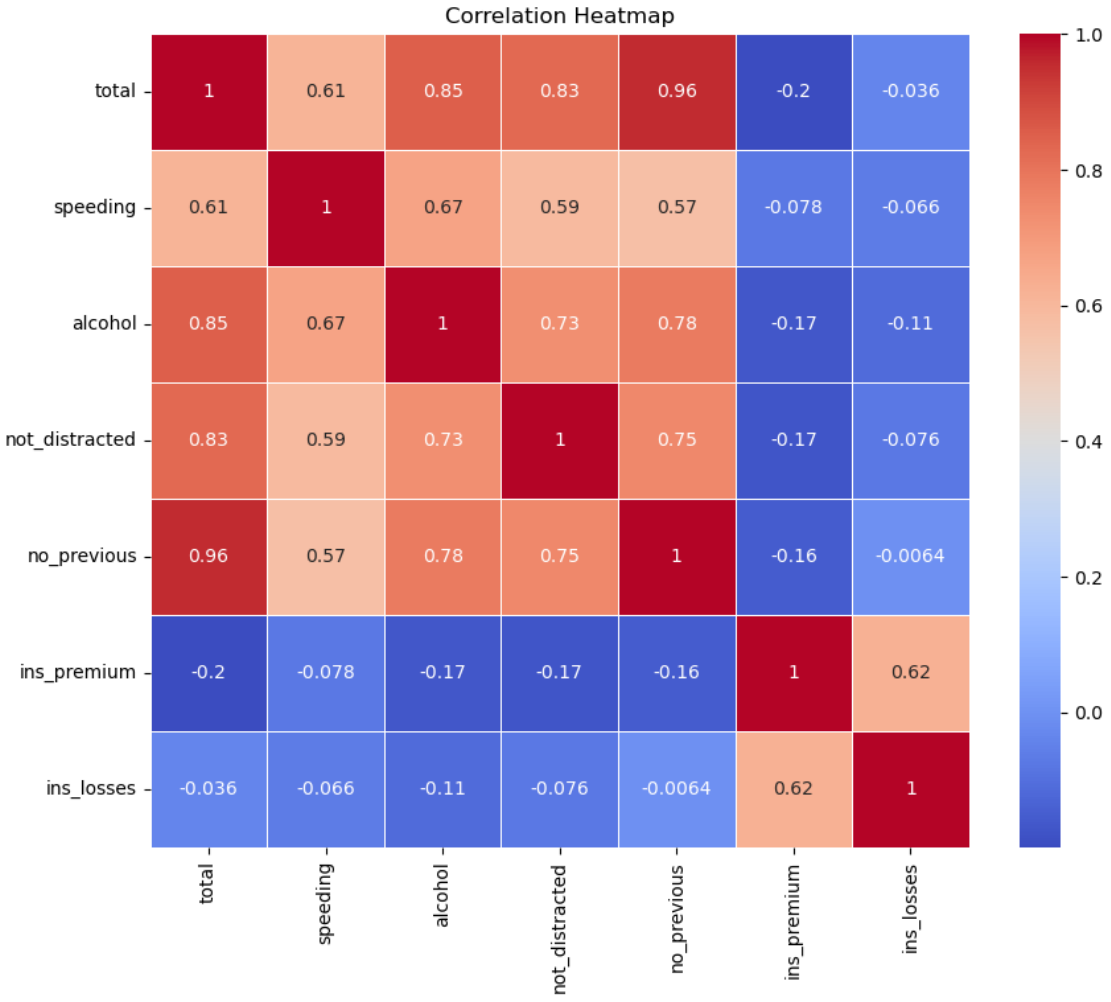
4 4. Barplot of 'abbrev' vs. 'total' car crashes (for each state)

[9]:
```
plt.figure(figsize=(12, 6))
sns.barplot(x='abbrev', y='total', data=car_crashes, errorbar=None)
plt.title("Barplot of Total Car Crashes by State")
plt.xlabel("State Abbreviation")
plt.ylabel("Total Car Crashes")
plt.xticks(rotation=90)
plt.show()
# Inference: The barplot displays the total number of car crashes for each␣
↪state. Some states have significantly higher car crash rates than others.
```



5 5. Correlation heatmap

[10]:
```
numeric_columns = car_crashes.select_dtypes(include=['number'])
correlation_matrix = numeric_columns.corr()
plt.figure(figsize=(10, 8))
sns.heatmap(correlation_matrix, annot=True, cmap="coolwarm", linewidths=0.5)
plt.title("Correlation Heatmap")
plt.show()
# Inference: The heatmap visualizes the correlation between numerical variables.
 ↪ For example, 'alcohol' and 'total' have a positive correlation, as␣
 ↪indicated by the warmer color.
```



6 6. Pairplot

[11]:
```
sns.pairplot(car_crashes)
plt.suptitle("Pairplot of Car Crashes Data", y=1.02)
plt.show()
# Inference: The pairplot provides scatterplots for all numeric variables,␣
 ↪showing relationships between them, as explained in the previous response.
```
